                                                                                                Treating subject,
The present sequence is that of the full-length form of human matriptase, a trypsin-like protease. This has an additional 172 amino acids compared with the truncated form of matriptase given in AAB19551. Either form can be produced in transformed or transfected cells using a claimed method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matriptase; serine protease; human; breast cancer; pre-malignancy; actinic keratosis; leukoplakia; Barrett's epithelium; columnar metaplasia; ulcerative colitis; bowenoid papulosis; adenomatous colorectal polyp; Qyerat erythroplasia; vulvar intraepithelial neoplasia; tumour; metastasis; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The zymogen (inactive) form of matriptase is a single-chain protein. The cative 2-chain form strongly interacts with fragments of a Kunitz-type CC serine protease inhibitor (hepatocyte growth factor activator inhibitor, CC HAI-1) to form SDS-stable complexed form. Only the complexed matriptase CC is present mainly as the uncomplexed form. Only the complexed matriptase CC in detected in human milk. The invention is directed to a method of CC detecting a malignancy or a pre-malignant lesion in breast or other CC tissue by detecting the presence of single- or 2-chain forms of CC matriptase in the tissue. The object is to inhibit tumour onset, tumour growth and metastasis. Malignancies and pre-malignant conditions CC characterised by expression of the zymogen or activated form of CC matriptase are treated by administering an inhibitor of matriptase, CC especially a Bowman-Birk inhibitor. The pre-malignant condition is CC atypical ductal hyperplasia of the breast, actinic keratosis, CC edenomatous colorectal polyps, erythroplasia of the Oueyrat, Bowen's CC disease, bowenoid papulosis, vulvar intraepithelial neoplasia or CC dysplatic changes to the cervix. The invention also provides methods for inhibitors identifying matriptase modulators, including activators and contentifying matriptase modulators, including activators and contentions of identifying matriptase modulators, including activators and contents of the cervix.

Increased expression of this protein is associated with cancer, and so the sequences can be used in cancer diagnosis and the identification of treatments. The present sequence is the MT-SP1 protein

thereof, which have properties related to the stimulation of biochemical complying properties related to the stimulation of biochemical complying properties in a cell, tissue, organ or organism. Complying the responses in a cell, tissue, organ or organism. Complying the responses in a cell, tissue, organ or organism. Complying the response of biologically active fragments for chiang notice and prognostic assays and furthermore in the treatment of complying the response of the treatment of the use of biologically active fragments for complying antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polymucleotides and antibodies are useful in the treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune completers, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, arthitis, Alzheimer's disease, infections, stroke, muscular dystrophy cand epilepsy. Accordingly, these molecules have many activities including cytostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, antiastatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, cassays to identify small molecules that modulate or inhibit, for example, assays to identify small molecules that modulate or inhibit, for example, caff as in chromosome mapping, tissue typing, preventive medicine and coff the invention.

The invention.

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing pharmacogenomics. 0 R

Disclosure; SEQ ID NO 419; 1498pp; English

Critis invention relates to a novel nucleic acids, and encoded polypeptides contereof, which have properties related to the stimulation of biochemical corphysiological responses in a cell, tissue, organ or organism. Critically, it refers to the use of biologically active fragments for cidiagnostic and prognostic assays and furthermore in the treatment of cidiverse pathological conditions. The present invention describes novel thuman and murine NOVX proteins, as well as methods to modulate their craments or preventing NOVX-associated disorders, e.g. cardiomyopathy, critically, respective, and peptide nucleic acids. Critically, conditions and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune critically, obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, canders, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, canderstic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, antiasthmatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, cassays to identify small molecules that modulate or inhibit, for example, caneurogenesis, wound healing and anoiocenesis. The nucleic arid are also consumers a wound healing and anoiocenesis. The nucleic arid are also consumers and anoiocenesis. neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel nucleic acids, and encoded polypeptid thereof, which have properties related to the stimulation of biochemica or physiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and speptide nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Li L, Gerlach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

Whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a nucleic acid of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as sportasts, inchaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

CC or physiological responses in a cell, tissue, organism or organism.

CC Specifically, it refers to the use of biologically active fragments for company or companism.

CC diagnostic and prognostic assays and furthermore in the treatment of conditions of the present invention describes novel to human and murine NOVX proteins, as well as methods to modulate their companism of the convention of the present invention describes novel companism or preventing NOVX-associated disorders, e.g. cardiomyopathy, contraining or preventing diseases such as inflammation, autoimmune contraining or preventing diseases inflections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cytostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, antiasthmatic, nephrotropic, antiarthritic, hepatotropic, anorectic, converting muscularity, rirucide, antiparastic, converting manunosuppressive, antiparastic, converting manunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

This invention relates to a novel nucleic acids, and encoded polypeptide thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and disbates. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune disorders, allergies, blood disorders, acquired immunodeficiency syndrom
                                                                                                                                                                                                                                                                                                                                     Li L, G

                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cycostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, hamostatic, anti-HIV, antidiabetic, antiarthritic, hepatotropic, antiasthmatic, nephrotropic, antiarthritic, hepatotropic, antiparasitic, neuroprotective, nootropic, antibacterial, virucide, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pharmacogenomics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
The present sequence represents a novel human extracellular serine protease, termed tumour antigen derived gene-15 proteain (see AAY06671), that is overexpressed in breast and overlan carcinomas. The TADG-15 gene (see AAX87815) can be used as a diagnostic and therapeutic target in ovarian carcinoma and other carcinomas including breast, prostate, lung and colon. The ligand binding domains of TADG-15 may be valuable in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             uptake of specific molecules into tumour cells. The invention also provides: a vector that is capable of expressing DNA encoding TADG-15 protein; host cells selected from bacterial cells (especially Bscherichia coli), mammalian cells, plant cells and insect cells; and a method of detecting expression of TADG-15 protein using a hybridisation probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                            541

TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel extracellular serine protease, termed tumor antigen-derived gene protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 855

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is human MTSP1 protein (also called matriptase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel single chain polypeptide comprising protease membrane-type serine protease or its catalytically for treating and preventing cancer and tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                      The invention relates to a purified single or two-chain polypeptide, which comprises the protease domain of a type-II membrane-type serine protease 7 (MTSP7) or its catalytically active portion. The polypeptide comprising MTSP7 is useful for detecting or diagnosing a neoplastic disease, a pre-malignant lesion, a malignancy or other pathologic condition in a subject. This polypeptide is also useful for monitoring tumour (e.g. tumour of the breast, cervix, prostate, lung, ovary or colon) progress and/or therapeutic effectiveness. The inhibitor of the polypeptide or treating or preventing a neoplastic disease, or tumour initiation, growth or progression, or a (pre-)malignant condition. The polypeptide or polynucleotide is also useful for identifying modulators of MTSP7, which may be used to treat cancers or tumours. This sequence represents a protein of the type-II membrane-type serine protease 1 relating to the

CC disgnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel CC human and murine NOVX proteins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polynuclectides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC (AIDS), obesity, asthma, immunoslobulin (Ig)A nephropathy, cirrhosis, and epilepsy. Accordingly, these molecules have many activities including CC cytostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic, cardiasthmatic, nephrotropic, antiarthritic, hepatotropic, antisatherial, virucide, antiparasitic, CC entiasthmatic, nephrotropic, antiatherial, virucide, antiparasitic, CC relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mappling, tissue typing, preventive medicine and CC of the invention. This polypeptide is a homologue of a human NOVX protein or the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches 851;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Li L, Gerlach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel nucleic acids, and encoded polypeptid thereof, which have properties related to the stimulation of biochemica or physiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 855
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; SEQ ID NO 352; 1498pp; English

           This invention relates to a novel nucleic acids, and encoded polypeptide thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune disorders, allergies, blood disorders, acquired immunodeficiency syndrom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Li L, G

In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomaics. This polypeptide is a homologue of a human NOVX protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic,

```
This invention relates to a novel nucleic acids, and encoded polypeptides CC thereof, which have properties related to the stimulation of biochemical CC or physiological responses in a cell, tissue, organ or organism. CC Specifically, it refers to the use of biologically active fragments for CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC disorders, alizates, blood disorders, acquired immunodeficiency syndrome CC (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, CC artharitis, Alzheimer's disease, infections, stroke, muscular dystrophy CC antiarthy, accordiant, antiinflammatory, immunosuppressive, antiallergic, CC heemostatic, anti-IHIV, antidiabetic, antiarteriosclerotic, anorectic, antiartharic, heparterronic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16-AUG-2001;

Gerlach
                                                       antiasthmatic, nephrotropic, antiarthritic, hepatotropic, neuroprotective, nootropic, antibacterial, virucide, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

The present invention describes a polypeptide comprising a purified comprise or two chain polypeptide, which comprises the protease domain of a C type-II membrane-type serine protease (MTSP10) or its catalytically cactive portion, or a matein of it, where up to 50 % of the amino acids c are replaced with another amino acid, and the resulting polypeptide is a c single chain or two chain polypeptide that has a catalytic activity of at C least 1-10 % of the unmutated polypeptide. MTSP10 has cytostatic c activity. The polypeptide containing the protease domain of the MTSP10 is useful for detecting a neoplastic disease, and for diagnosing the condition in a subject, or monitoring tumour (e.g. breast, cervix, c prostate, lung, ovary or colon tumour) progression and/or therapeutic c domain of MTSP10 is useful for treating or preventing neoplastic disease c in a mammal. An inhibitor of the polypeptide containing the protease in a mammal. An inhibitor of the polypeptide containing the protease c fithe MTSP10 polypeptide is useful for inhibiting tumour initiation, c growth or progression, or treating (pre-)malignant conditions of the e.g. C breast, cervix, prostate, lung, ovary or colon. The present sequence c represents human MTSP1 (also known as matriptase), which is used in an c c example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptides comprising the protease domain of a type-II membrane-type serine protease (MTCP10), or its muteins, useful for diagnosing neoplasms or malignancies, or for screening for MTCP10 inhibitors for treating such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 181-183; 198pp; English

The invention relates to serine protease 17 polypeptide designated CVSP17 and its corresponding nucleic acid sequence. The invention also relates to a method using CVSP17 protein to identify compounds that modulate its protease activity. The method is useful for preventing, diagnosing and treating disorders related to the serine protease 17 activity, such as
                                                                                                                                                                                                                                                   New substantially purified serine protease 17 polypeptide and encoding nucleic acid, useful for diagnosing and treating tumor conditions and/or cancer, particularly of the breast, cervix, prostate, lung, ovary or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to type II membrane-type serine protease 9 (MTSP9) polypeptides and polynucleotides. MTSP belongs to type II transmembrane serine protease (TTSP) family. Sequences of the invention and their antibodies are useful for diagnosing, treating or preventing neoplastic disease in mammals. They are useful for monitoring tumour progression, inhibiting tumour initiation, growth or progression or treating malignant or pre-malignant conditions. Transgenic animals of the invention are useful in animal models of tumour initiation, growth and/or progression models. The invention is also useful in gene therapy. The present sequence is human membrane-type serine protease 1 (MTSP1). MTSP1 also referred as matriptase is a member of the TTSP family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New substantially purified single or two-chain type II membrane-type serine protease 9 (MTSP9) polypeptide, useful for monitoring tumor progression, inhibiting tumor initiation, or treating a malignant or premalignant condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; type II membrane-type serine protease 9; tumour; transgenic; type II transmembrane serine protease; enzyme; gene therapy; MTSP9; neoplastic disease; transgenic animal; membrane-type serine protease 1; TTSP; MTSP1; matriptase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 855

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to transmembrane serine protease 14 (CVSP14), its nucleic acid sequence and the method based on them. The methods and compositions of the invention are useful for diagnosing, preventing and/or treating conditions associated with the aberrant expression or activity of the CVSP14 polypeptide, such as cancers and malignancies of the breast, cervix, prostate, lung, ovary or colon. The methods are also useful for identifying compounds that will modulate the protease activity of CVSP14 polypeptide, and monitoring tumour progression and/or therapeutic effectiveness. CVSP14 DNA used in gene therapy. The present
